EUROGOMMA

Wear-resistant polyurethane linings for vibratory finishing bowls and polishing drums

In surface finishing, the drum is the heart of the process. **EUROGOMMA** makes custom polyurethane linings for polishing drums and vibratory finishing bowls, ensuring consistent performance, long service life and maximum reliability.

Two technologies, one tailor-made solution

- **Cast polyurethane:** compact, uniform linings, ideal for high thicknesses and heavy-duty loads.
- **Spray polyurethane:** fast, continuous application, perfect for refurbishment, complex geometries and reduced machine downtime.

Refurbishment and new linings

We work on both new and worn drums: we remove the old lining, prepare the substrate and apply a new layer, restoring the machine to full performance.

Why choose EUROGOMMA

- High resistance to abrasion and wear
- Reduced noise and vibration during processing
- Excellent adhesion to the metal substrate

- Protection of both the drum and the treated parts
- Hardness and formulations chosen to suit the process and abrasive media

Expertise at your service

Every plant has different needs. Our team analyses your process and proposes the most suitable solution, with reliable lead times and attentive service.
