

EUROGOMMA

Elastic polyurethane screen panels with boomerang shaped and peanut shaped apertures

It's no secret that flip-flop is the globally recognised screening technology giving the highest efficiency results for the treatment of all sticky, clogging and sharp materials that typically create blinding in standard screening applications.

However flip-flop screening is not "the solution for all occasions". In some cases high moisture material and special environment conditions, especially in those parts of the World having dry and rainy seasons, flip-flop screens suffer blinding anyway.

For all those cases **EUROGOMMA** has created THE SOLUTION

EUROGOMMA is the unique Manufacturer of elastic flip-flop screen panels having boomerang shaped and peanut shaped apertures.

The shape of these apertures gets stretched and relaxed together with the screen mats thanks to the action of flip-flop mechanism.

This effect is exponentially improving the working principle of flip-flop screens.

Change your flip-flop deck to a flip-flop² deck!
