

EUROGOMMA

Elastic polyurethane screen panels with boomerang shaped and peanut shaped apertures

It's no secret that flip flow is the globally recognised screening technology giving the highest efficiency results for the treatment of sticky, clogging and sharp materials that typically create blinding in standard screening applications.

However flip flow screening is not "the solution for all occasions". In some cases high moisture material and special environment conditions, especially in those parts of the World having dry and rainy season, flip flow screens suffer blinding anyway.

For all those cases **EUROGOMMA** has created THE SOLUTION

EUROGOMMA is the sole Manufacturer of elastic flip flow screen panels having boomerang shaped and peanut shaped apertures. These apertures get stretched and relaxed together with the screen mats thanks to the flip flow stroke action.

This effect exponentially increases the working principle of flip flow screens.

Change your flip flow deck to a flip flow² deck!
