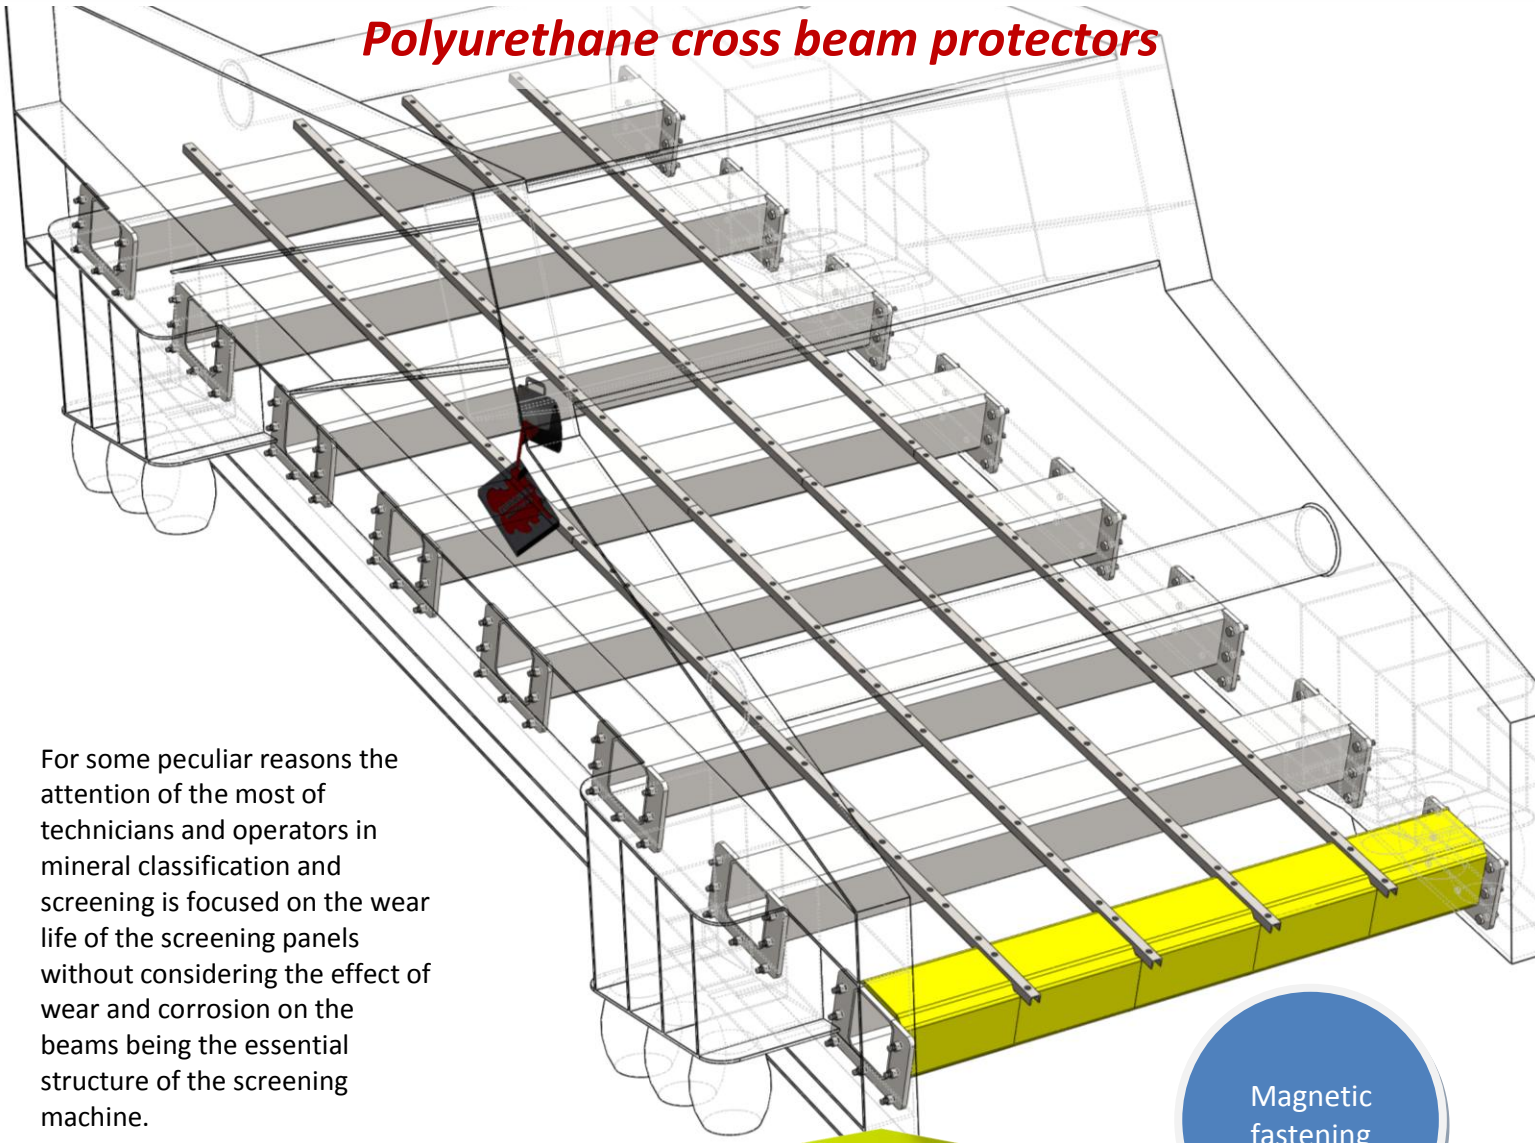
EUROGOMMA

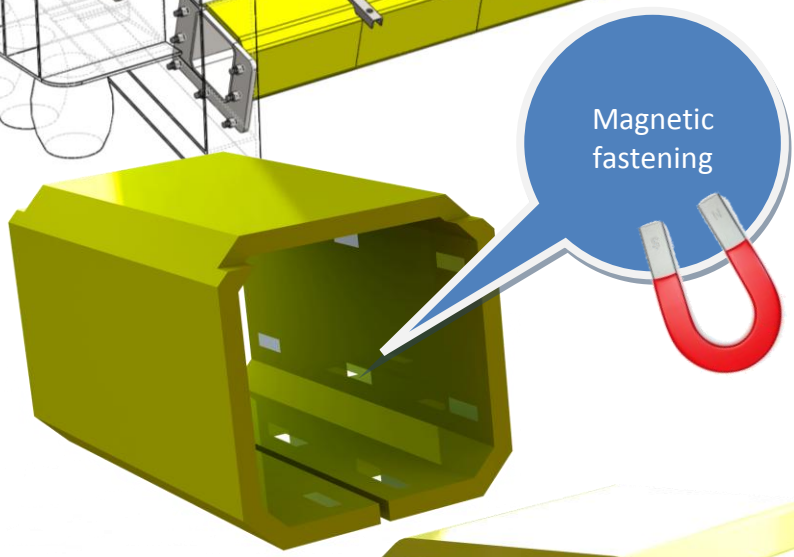
Polyurethane cross beam protectors

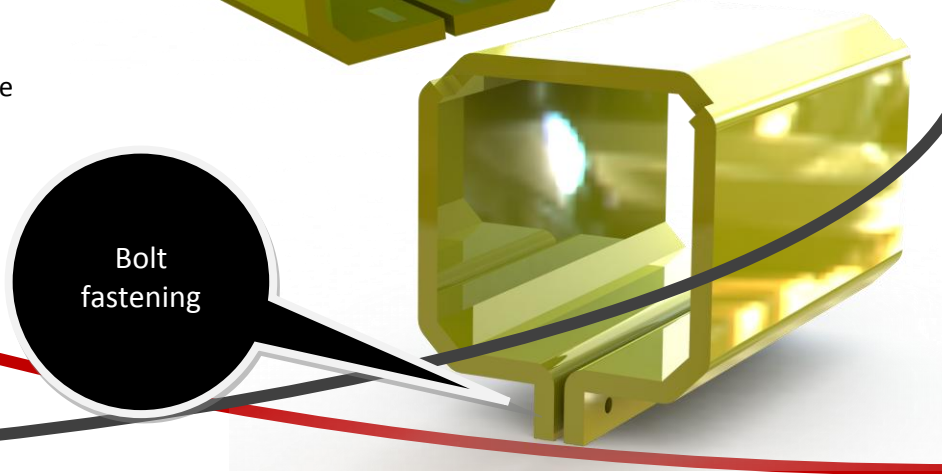


For some peculiar reasons the attention of the most of technicians and operators in mineral classification and screening is focused on the wear life of the screening panels without considering the effect of wear and corrosion on the beams being the essential structure of the screening machine.

It's a definitive fact that the wearing or anyway damaging of the cross beams would affect the mechanical stability of the screen with tremendous consequences if not repaired in time.

Isn't It better to protect the beams from the very beginning in order to prevent future problems and enormous costs?
EUROGOMMA designs and manufactures polyurethane protectors fitting perfectly on the beam and avoiding any future maintenance.





If vibrating screens in mineral and aggregate scalping or anyway heavy duty applications are those subjected to the highest wear rate also flip-flop screens are suffering problems with cross beams.
In these situations, especially in the field of material recycling, screening material is often attaching to the beams with both abrasive and corrosive effect.
So, once again, our polyurethane protectors do the job.

Contact us with your inquiries on how protecting your screens. We are sure this would cost you less than changing your beams once every while.
