

EUROGOMMA

Polyurethane lined elbow pipes

EUROGOMMA manufactures polyurethane lined elbow pipes for the most aggressive installations.

The proved wear resistance characteristics of our polyurethane elastomer find perfect application in this field.

In fact the high abrasion resistance and resilience of our polyurethane permit the elbows to resist the aggression of sharp and abrasive solid particles in the flowing pulp

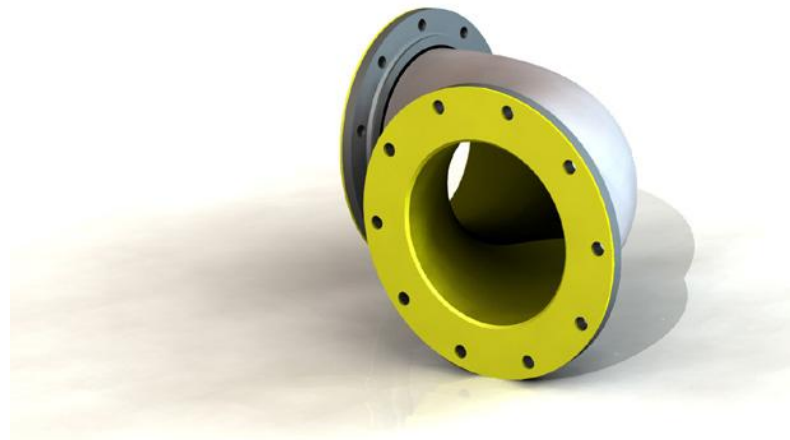

When flowing into the elbow the solid part of the pulp gets separated from the liquid part because of the centrifugal force.

In fact the bulk density of the solid particles push them to the inner external perimeter of the elbow letting water flow internally.

The smashing and abrasive action of the solid particles leads to high wear of the elbow's inner external perimeter.

The resilience of our polyurethane permits our lining to resist this abrading force protecting the elbow from wearing out.

The protection of elbows with our polyurethane offer unique advantages to our clients drastically reducing maintenance in pipe lines
