## *Polyurethane liners for Washing Trommels*

Washing Trommels are one of the typical applications where tear and wear play an important role because of the shocks produced by the large rocks entering the Trommel. That's why resilient materials demonstrate to be the ideal to last the longest in this application. Therefore the adoption of our **Superelastic** polyurethane guarantees long life, less maintenance and total noise abatement.

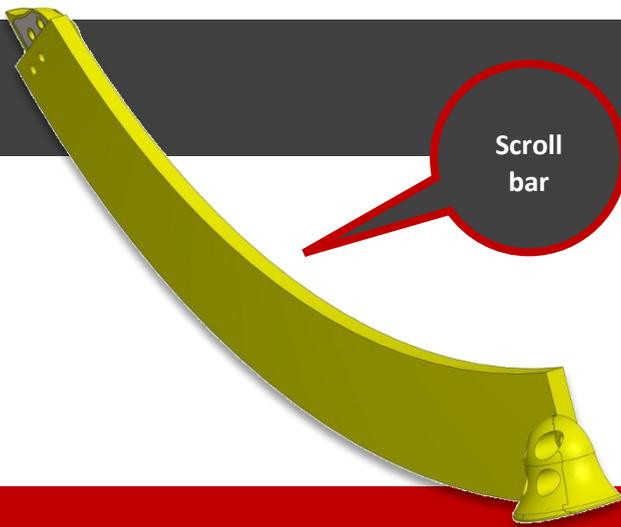

Besides the enviable abrasion resistance of our polyurethane allows our liners to resist the abrasion due to the sliding friction of sand and gravel inside the Trommel.

**EUROGOMMA** manufactures modular backed steel liners to protect the internal surface of the Washing Trommel. Our liners are custom made to offer the highest wear resistance and are bent to find rapid and precise application inside the Trommel. Both bolting and welding systems are available to do the installation.

Wear tests comparing our polyurethane liners with rubber or metal demonstrate that the excellent technological characteristic of our elastomer are a sure proof of **longer wear life**.

Besides we can engineer and manufacture customized solutions like polyurethane scroll bars, lifting bars, weir bars and blades to increase the operative performance of every Washing Trommel.

Lifting bar

**We engineer customized lining system to offer the best performance in:**

- **Wear life**
- **Material cleaning**
- **Energy consumption**

**Modular construction guarantees the rapid replacement of the liners at every maintenance.**
