

EUROGOMMA

SUPA 
TOUGH BOY

SUPA TOUGH BOY is **EUROGOMMA**'s solution for the most extreme screening applications, where violent impacts and accelerated wear make all conventional products on the market ineffective.

Made from high-resistance polyurethane, **SUPA TOUGH BOY** panels are engineered to deliver superior performance under harsh conditions: abrasive materials, sharp edges, coarse particle sizes, and high-impact drops are no longer an unsolvable problem.

Design compatible with the **EURO-PS** standard.

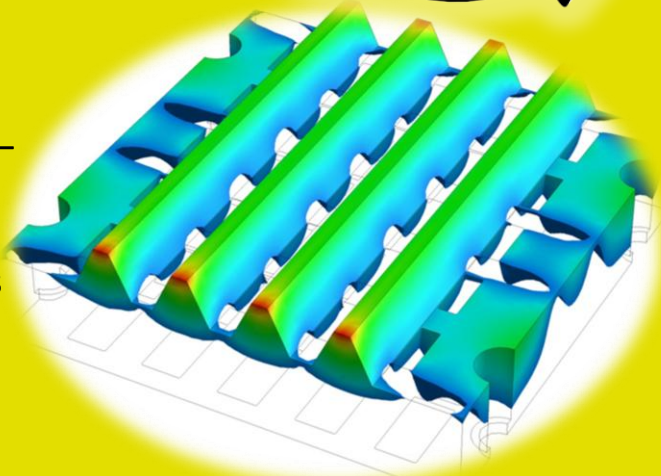

SUPA TOUGH BOY panels are designed to match the dimensions of the EURO-PS model — 305x305mm — ensuring perfect interchangeability.

This dimensional compatibility allows both models to be installed on the same screen deck, optimizing the wear strategy.

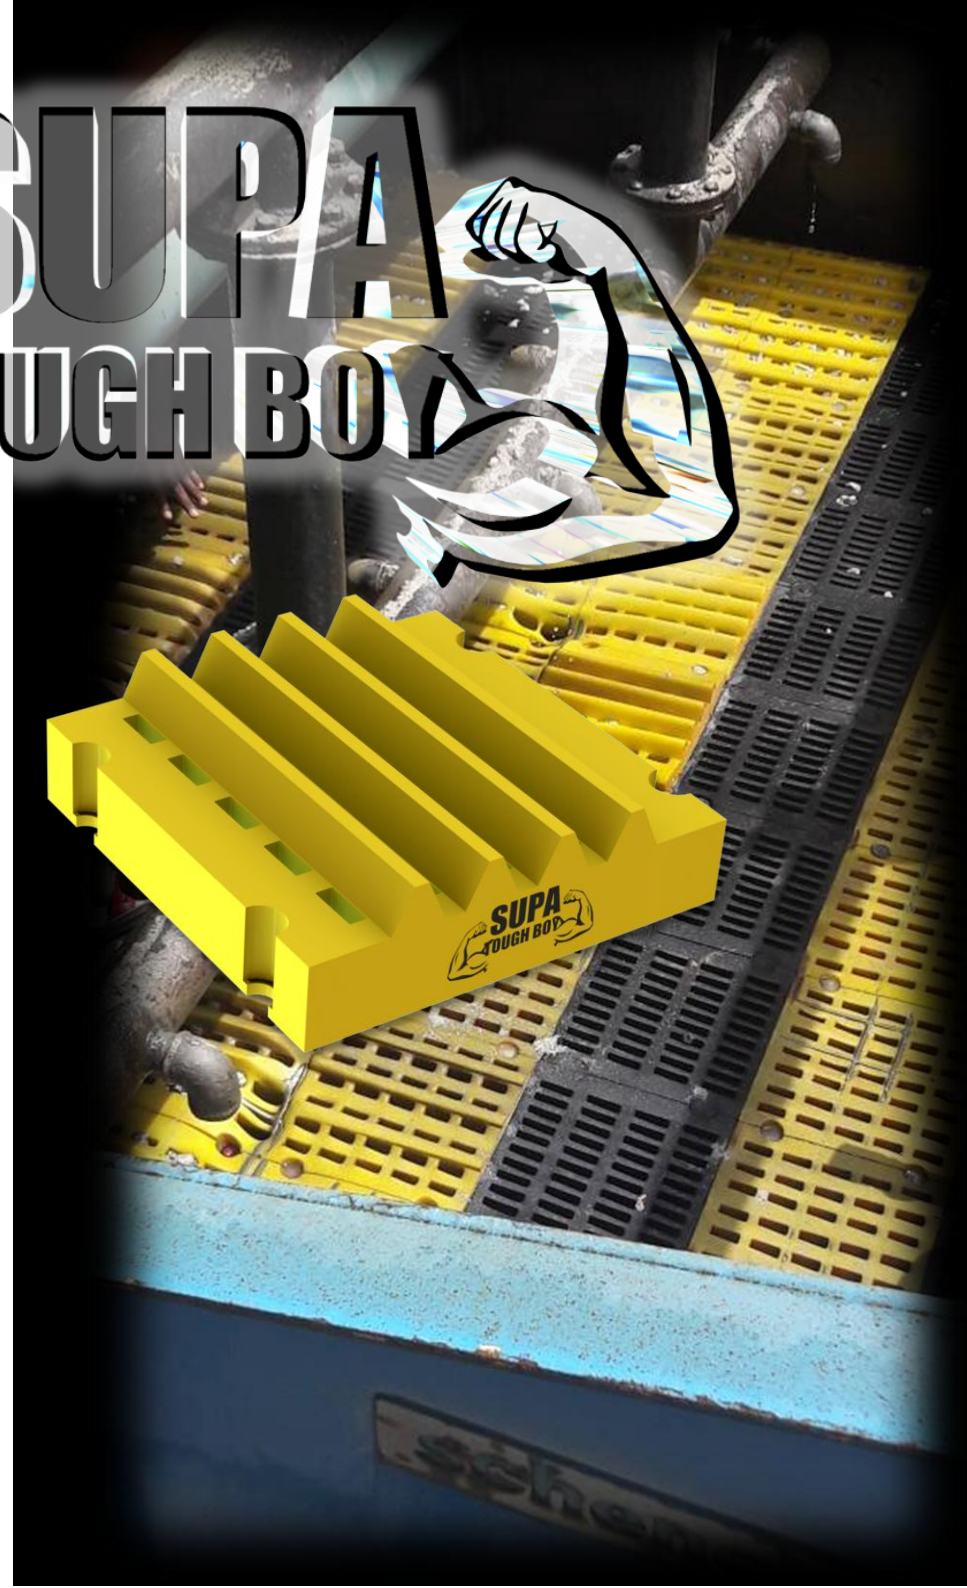

SUPA TOUGH BOY panels can be placed in high-impact zones, while standard **EURO-PS** panels cover areas subject to lower stress.

Key benefits:

- Exceptionally long service life even in the most critical conditions
- Reduced downtime and maintenance costs
- Fast installation thanks to compatibility with existing **EURO-PS** systems
- Maximum productivity through the optimal combination of panels on the same screen deck
- FEM analysis-supported design to ensure maximum structural strength

Skinny Boy

Skinny Boy is the good companion of **SUPA TOUGH BOY**. He was designed with a precise purpose: to balance the screening deck, compensating for **SUPA TOUGH BOY**'s significant weight and distributing loads optimally.

Without him, the plant would operate out of balance.

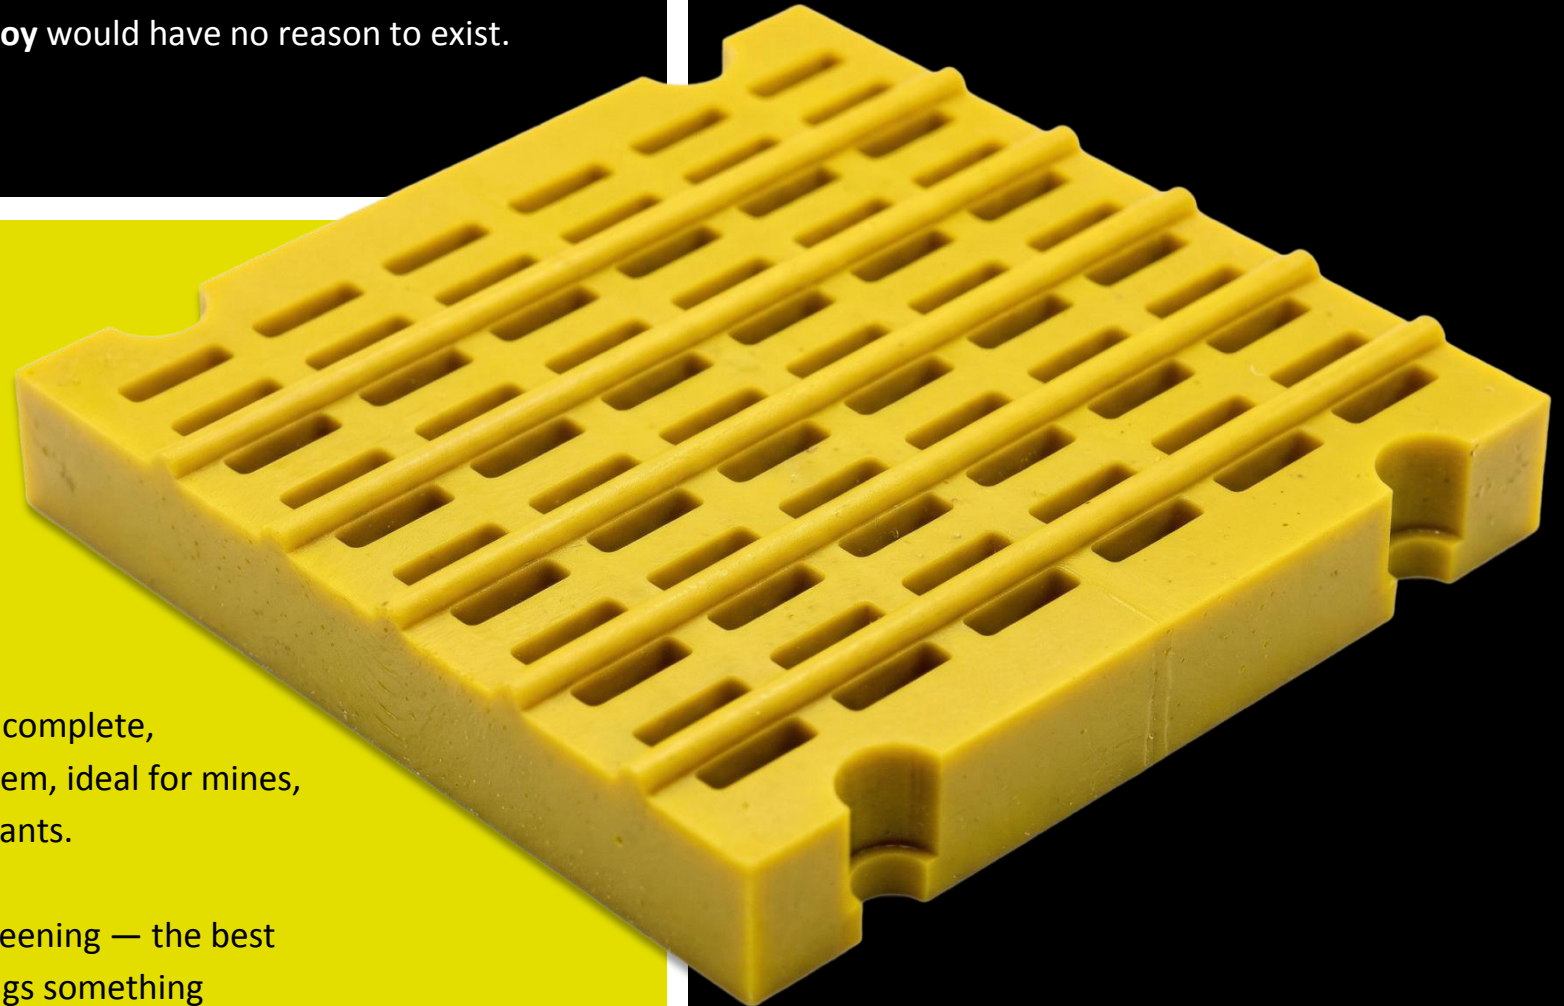

Without **SUPA TOUGH BOY**, **Skinny Boy** would have no reason to exist.

They are a true pair.

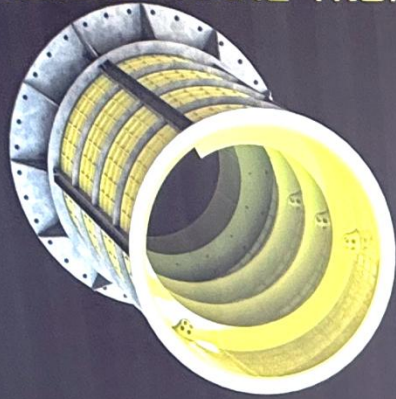

Yet **Skinny Boy** should not be underestimated. Beneath his slim profile lies a tough core: a strong internal steel frame providing high mechanical resistance, while the polyurethane ensures durability and abrasion resistance even in the harshest conditions.

Together, these two "friends" form a complete, balanced, and efficient screening system, ideal for mines, quarries, and aggregate processing plants.

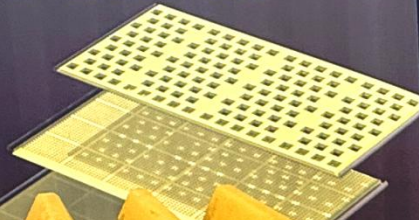

Because in life — and in industrial screening — the best teams are those where everyone brings something unique. And together, they make the difference.
