## Interchangeable polyurethane liners

Our interchangeable polyurethane liners are made of carbon steel or stainless steel sheets coated by high-density polyurethane elastomer. They can fit vibratory feeders, hoppers, chutes, slides and other conveying surfaces.

These liners offer several qualities which are mainly recognisable in:

excellent wear resistance (superior to Rubber, Steel, UHMW and Ceramic)

noise abatement

avoidance of clogging problems due to sticky or aggregating materials thanks to the low friction coefficient of polyurethane

simple and rapid installation due to the lightness of the lining modules and to limited number of needed bolting spots

complete replacement of the lining modules

tailor designed geometry permitting the lining of every flat or curve surface
