

EUROGOMMA

Polyurethane self supporting screen panels

Our polyurethane self supporting screen panels are the right product for all those applications where durability, solidity and wide screen surface are required.

These products are installable on all vibrating screens through cross or long tensioning bars.

Our polyurethane self supporting screen panels have an internal frame made of steel ropes or round bars.

This structure make the product installable both on flat and curved decks.

In fact the frame is solid but anyway bendable.

Screening areas can be rigid either flexible and highly wear resistant.

These characteristics make our polyurethane self supporting screen panels ideal to all those applications where high durability is required without switching to modular screen systems.

It's a matter of fact that the solidity of the product can be a problem whenever sticky and clogging material is to be screened.

In this case we propose our flexible tensioned screens offering excellent screening performance in every situation.
