

Rubber screening media

for **TOUGH**
APPLICATIONS

EUROGOMMA

EUROGOMMA is happy to propose to our clients in mining the new range of our rubber screen panels for tough application like crusher screens and primary ore screening.

Our factory in Russia has celebrated 10 years of productive activity in 2018 and this time lapse has permitted our company to create strategic cooperation with some of the main players in mining in the country.

Tough rubber screens have been widely used in Russian mining plants for the last decades and now we can use this experience to offer our global Clientele a long lasting and highly wear resistant product.

Our product range is made of all the components which are necessary to a full deck construction:

- Screen panel
- Central hold down bar
- Side bar

Tough rubber screen panel 610x610mm or similar for top decks

Rubber screen panel 610x610mm or similar for middle and bottom decks

Rubber blank panel 610x610mm or similar for top, middle and bottom decks

Rubber central hold down bar

Rubber side bar

Together with our self-supporting rubber screens we offer a wide range of rubber lining for Ball and SAG Mills.

The high wear resistance and resilience of our rubber make our lifting bars and liners suitable to every application in mining.

Our lining systems are designed to fit in all the major brands of Mills for mining and we can easily design and produce specific products for customized applications.

If it is true that our rubber screens are mainly addressed to tough applications, rubber is sometimes preferred to polyurethane in some standard situations like gross and trommel screening.

In these occasions our **ERStep** and **EURO-PS** screen panels are made of rubber.

Our screen panels are supplied with rubber weir and scroll bars if needed.

Our target is the complete satisfaction of our clients.

We do not mind if rubber or polyurethane is the way to achieve the target.
