

EUROGOMMA

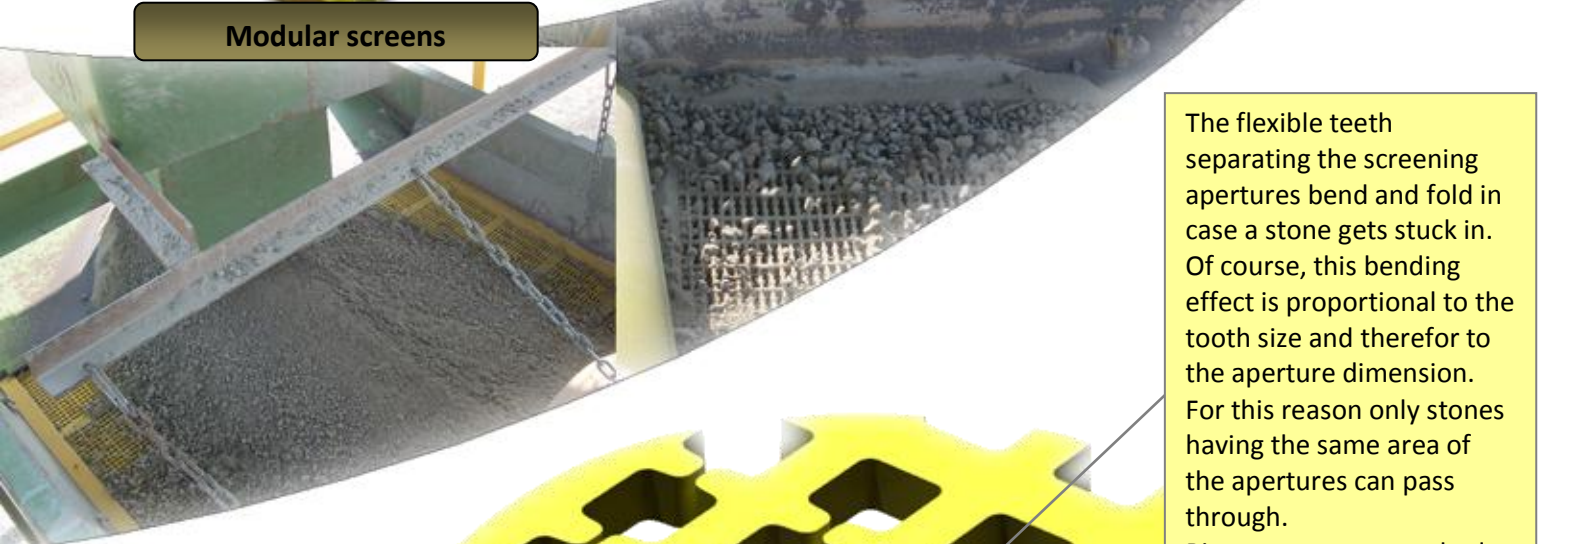

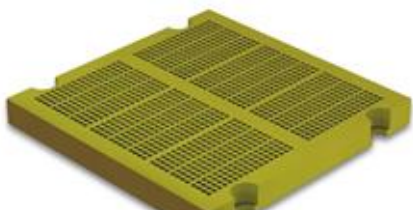

Polyurethane screen panels with non-blinding apertures

Tensioned screens

Our polyurethane tensioned and modular screens with **Superflow** apertures are undoubtedly the most suitable product to screen abrasive and sticky or clogging materials. The extraordinary design of **Superflow** apertures and the elasticity of polyurethane making our products guarantee excellent screening performances joined to enviable wear life.

Modular screens

The flexible teeth separating the screening apertures bend and fold in case a stone gets stuck in. Of course, this bending effect is proportional to the tooth size and therefore to the aperture dimension. For this reason only stones having the same area of the apertures can pass through. Bigger stones are pushed upwards thanks to the elastic action of teeth
